# Surrounding Connections

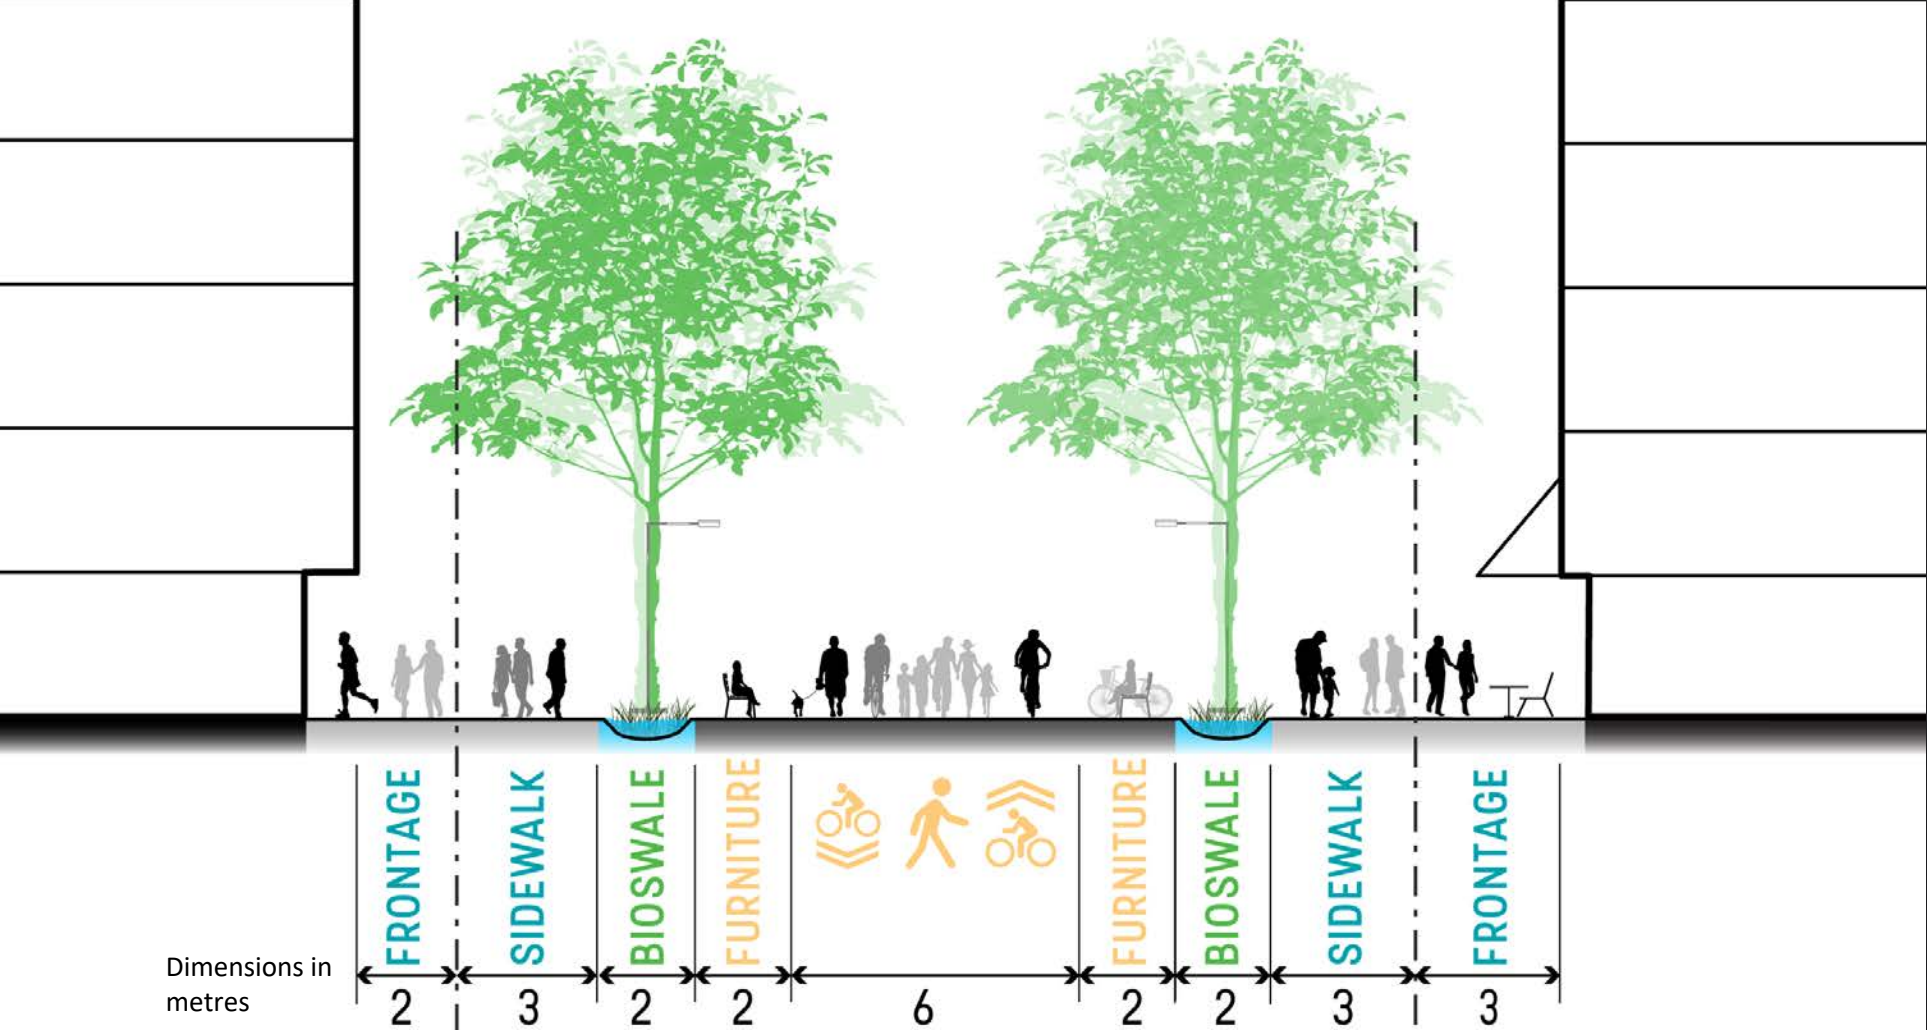

# Road Typologies

- Manchester Boundary
- Red LRT Line
- LRT Stations
- Streetcar Stations
- Pedestrian and Cyclist
- Shared Streetcar
- Shared Auto
- Major Roads
- Central Parkade

# Pedestrian and Cyclist Only Street

# Shared Streetcar

# Shared Automobile Street

# Transportation Membership

## Mandatory Fees

- ◇ Unlimited streetcar use
- ◇ Access to the Manchester Car Pool (MCP)
- ◇ Unlimited use of Manchester Bike Pool (MBP)

BIKETOW  
N,  
Portland

## Optional Fees

- ◇ Subsidized Calgary Transit pass
- ◇ Unlimited access to all secure bike storage

Secure storage,  
London

# Transportation Membership

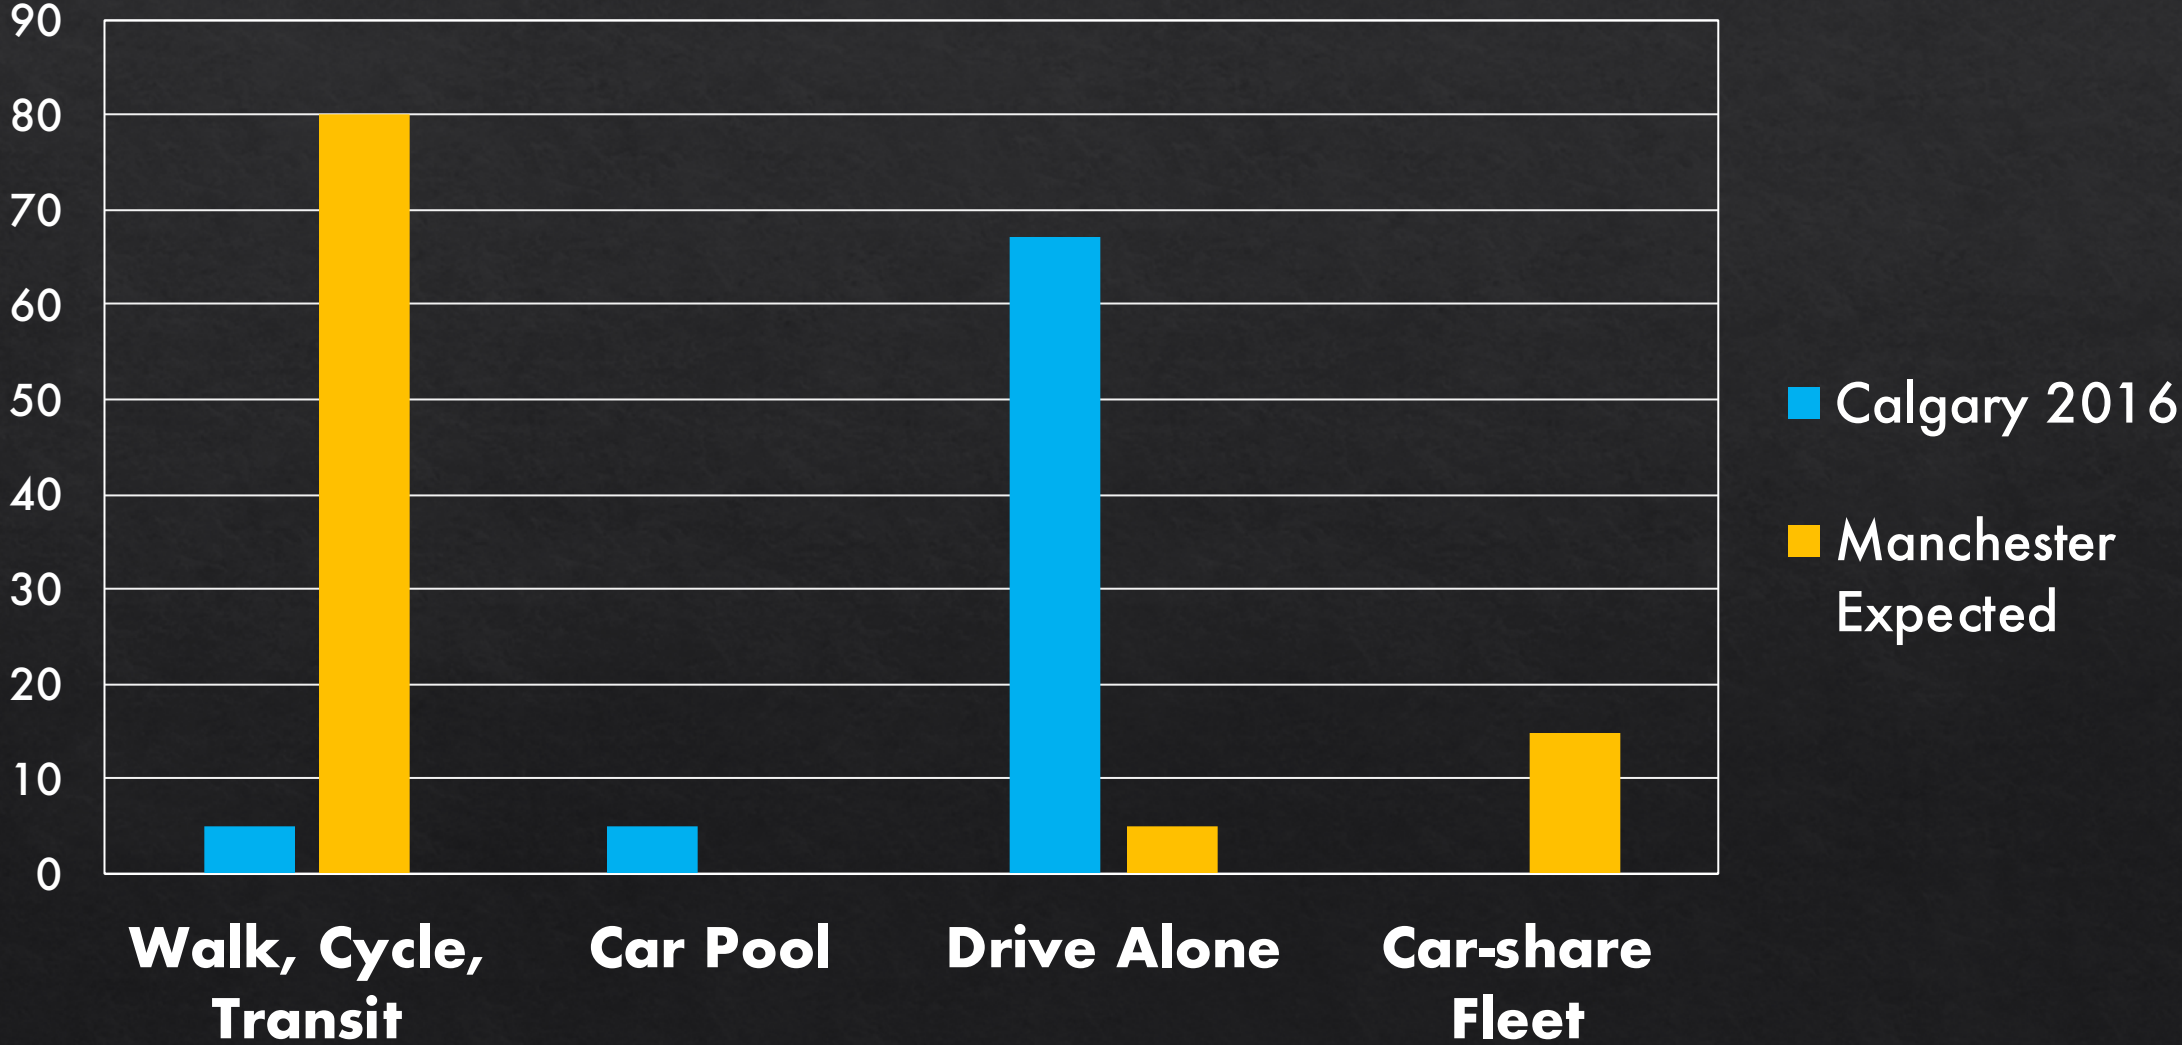

## Manchester Car Pool

- ◇ Within community: 5 free one-way trips per week (max 1 hr per trip)
- ◇ Outside community: minute, hourly, daily rates
- ◇ Incremental pricing: frequent use → higher individual prices
- ◇ Designated stalls in the central underground parkades
- ◇ Drop off / pick up zones throughout community

## Manchester Bike Pool

- ◇ Designated stalls at LRT and streetcar stations
- ◇ Various stalls located throughout the community

# Modal Split

2016 Calgary city-wide modal split from City of Calgary Civic Census

# Stormwater

*Fair Share  
Ecological  
Footprint*

# Rain/Snow – Water Consumption

## Calgary

Average Monthly Water Usage Per Person

7 cubic meter /  
month

Average Monthly Rain/Snow fall

320 mm

412 mm

## Manchester

Demand

67000  
users

469,000 cubic meter per month

Supply

501,369 cubic meter per month

# Rainwater Harvesting

Block Level Water  
Collection & Treatment and Supply System

## Uses

- ◇ Irrigation
- ◇ Gardening
- ◇ Toilets
- ◇ Laundry
- ◇ Potable Water

## Benefits

- Save Money
- Healthier and Faster
- Naturally Soft
- Avoid Water Bans
- Chlorine Free

# Rainwater Harvesting

## Capital Regional District

625 Fisgard Street, Victoria, BC

The building uses a 60,000 litre concrete cistern to capture rainwater for reuse in low flow/dual flush toilets. The filtration and chlorination of roof water was required by plumbing code, as was a sign warning toilet users not to drink the water.

Phase two of the building was Victoria's first Gold LEED tm. certified building. Landscaping includes no permanent irrigation.

## Gulf Islands National Park Reserve, Operations Centre

2220 Harbour Road, Sidney, BC

A 30,000 litre underground storage tank for roof rainwater provides water for reuse in low flush toilets and for washing saltwater from marine equipment. Up to 108,000 litres of rainwater can be collected and reused annually.

The building is Canada's first Platinum LEED™ building, with a minimum building footprint on an existing urban lot. Features include drought tolerant landscaping plants, a saltwater geothermal loop and photovoltaic panels. Energy savings should realize a 3.2 ton annual greenhouse gas savings.

# Rainwater Harvesting

# Mountain Equipment Co-op

1450 Government Street, Victoria, BC

- ◇ Rainwater capture and reuse is being employed for toilet flushing. A total storage capacity of 5682 litres is available under the sidewalk.
- ◇ The use of rainwater and dual flush toilets has reduced water use by 48%.

## Rainwater Harvesting

# Bioswale

Provision of bioswale to collect and manage storm water

## Benefits

- ◇ Reduction in peak water flow to our waterways
- ◇ Removal of pollutants from storm water
- ◇ Improved storm water infiltration
- ◇ Decreased downstream/riverbank erosion
- ◇ Improving aesthetic of the area

# Permeable Pavement

Provision of permeable surfaces to support storm water management

## Benefits

- ◇ Allowing ground water levels to be replenished
- ◇ Reducing peak runoff periods which can minimize local flooding
- ◇ Reducing the total volume of storm water runoff from a catchment area which reduces the potential for erosion of our riverbanks
- ◇ Filtering pollutants through the rock drainage layers and the subsoils below.
- ◇ Research on permeable pavement shows they are effective in removing pollutants such as total suspended solids, heavy metals, oil and grease.

# Energy Provision

*100% Renewable  
Energy*

*80% GHG  
Reduction*

# Electricity Demand

**Predicted Electricity Demand in South Manchester = 810,000 MWh/year**

**Required panel efficiency at 50% site coverage = 44%**

**\* Assumption \***

**50% reduction in energy consumption by 2060**

- ◇ Technology and efficiency improvements
- ◇ Use of 2015's best available technologies would reduce residential energy consumption 50%, 46% for commercial (*USA Department of Energy, 2015*)
- ◇ Passive solar building design – energy savings up to 90% for heating (*Pembina*)

# Electricity Demand

NEW Required panel efficiency at 50% site coverage = 22%

OR

**NEW Required panel efficiency at 25% site coverage = 44%**

**\* Assumption \***

**44% efficient solar panels readily available in 2060**

- ◇ 44.5% efficient solar cells tested in 2017 (*Lumb et al., 2017*)
- ◇ Spectrolab (Boeing subsidiary) tested efficiency: 40.7%
- ◇ Conservative estimate

# Providing the Energy: Panel Placement

Required site coverage at 44% efficiency = **25%**

Solar Landfill – 12.5% of site coverage

Solar Roofs – 12.5% of site coverage

# Natural Gas Demand

## Converting Natural Gas to Electricity Demand

How much natural gas energy do we use?

Alberta apartments avg.  $0.063 \text{ GJ/ft}^2 \cdot \text{year}$  (*Efficiency Alberta*) =  $17.5 \text{ kWh / ft}^2 \cdot \text{year}$

How much energy per dwelling?

Avg.  $900 \text{ ft}^2/\text{dwelling} * 17.5 \text{ kWh/ft}^2 * \text{year} = 15,750 \text{ kWh/dwelling} * \text{year}$

How many dwellings in our site?

$50,000 \text{ people} / 2.5 \text{ people per dwelling} = 20,000 \text{ dwellings}$

Total converted residential energy use?

$20,000 \text{ dwellings} * 15,750 \text{ kWh/dwelling per year} = 315,000,000 \text{ kWh}$

Total converted natural gas to electricity demand?

Residential =  $315,000 \text{ MWh} * 1.3$  (30% for commercial/industrial) = **410,000 MWh**

# Natural Gas to Electricity Demand

**Predicted Natural Gas to Electricity Demand = 410,000 MWh/year**

**Required panel efficiency at 50% site coverage = 22%**

**\* Assumption \***

**50% reduction in energy consumption by 2060**

- ◇ Technology and efficiency improvements
- ◇ Use of 2015's best available technologies would reduce residential energy consumption 50%, 46% for commercial (*USA Department of Energy, 2015*)
- ◇ Passive solar building design – energy savings up to 90% for heating (*Pembina*)

# Natural Gas to Electricity Demand

NEW Required panel efficiency at 50% site coverage = 11%

OR

**NEW Required panel efficiency at 25% site coverage = 22%**

**\* Assumption \***

**22% efficient solar roadways/facades readily available in 2060**

- ◇ Colas – Wattway 1km solar road in France constructed in 2016.
- ◇ Solar Roadways – Research ongoing, funding through US Dept. of Transportation
- ◇ Estimates 30% less power generated than angled panels (*Solar Roadways*)

# Providing the Energy: Panel Placement

Required site coverage at 22% efficiency = **25%**

Solar roads/paved surfaces – 20% coverage

Building Façade Integration – 5% coverage

# Going Electric: Reduction in Carbon

GOAL: 80% GHG Reduction

# Infrastructure Nexus

# Nexus: Mobility + Stormwater

## Bio-swale Integration with Roads

- ◆ Mobility systems that are designed in conjunction with storm systems are efficient at collecting and filtering stormwater, can reduce cost of paving and pipe infrastructure
- ◆ Public realm is enhanced

# Nexus: Solar Energy + Stormwater

## Solar Green Roofs

## Roadway storage, treatment and transport

- ◆ Solar Roadways® integrates a stormwater capture system. Storm water is collected, can be pumped to a water treatment facility, or pre-treated on site and released into aquifer

# Nexus: Solar Energy + Mobility

## Infrastructure:

- ◇ Powers streetlights, urban furniture, traffic lights reducing infrastructure cost.
- ◇ Embedded LED lights replace paint to make road lines and signage, warn drivers of dangers

## Winter cities:

- ◇ Solar Roadways® panels with integrated heating component maintains a temperature above freezing

## Electric Vehicles:

- ◇ Can provide the infrastructure needed to charge EV's

## Autonomous Vehicles:

- ◇ Panel micro processors replace dependence on satellites (GPS) to determine location

# **Supporting Infrastructure**

# Hickory Ridge: Landfill Reclamation Efforts

- Total Area is 48 acres
  - Largest Solar Energy Generating Facility in Georgia
- Built of a Geomembrane Anchoring System
  - 7,000 Solar Panels on hillside
  - Able to produce 1 megawatt
- Advantages
  - Cheaper than traditional closure procedures
  - Contributes to clean water management
  - Reduces GHG emissions from maintenance of traditional site

# Freshkills: Landfill Reclamation Efforts

- Previously a Landfill site for New York City
  - Established in 1947
  - Largest Landfill while it was open
- Master Plan was created to reclaim the former landfill site into a large public park for the city
  - To serve the public as a natural haven, but to also reduce the impact of natural disasters prone to the region
- Act as example for other reclamation efforts in the United States

THE FRESH KILLS PARK DRAFT MASTER PLAN  
WHAT IS LIFESCAPE

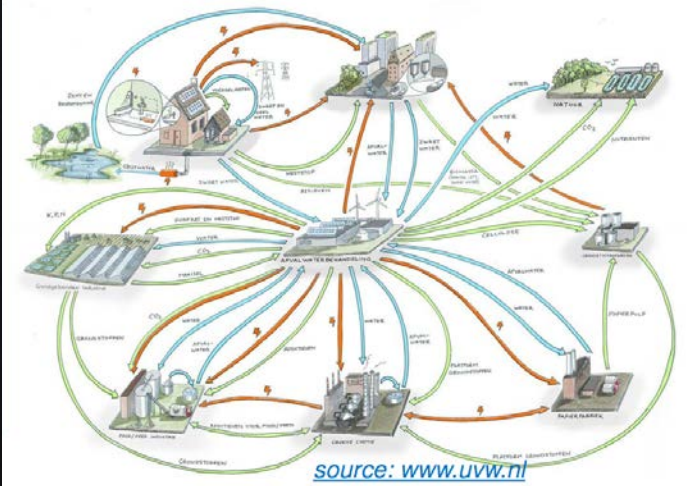

# Amersfoort Water Treatment Facility: Mineral Reclamation & Water Purification

WWTP Amersfoort (300.000 p.e.)

Pearl® and WASSTRIP® at wastewater treatment plant

Creating value through connecting!

# Hyderabad, India: Water Treatment for Agricultural Use

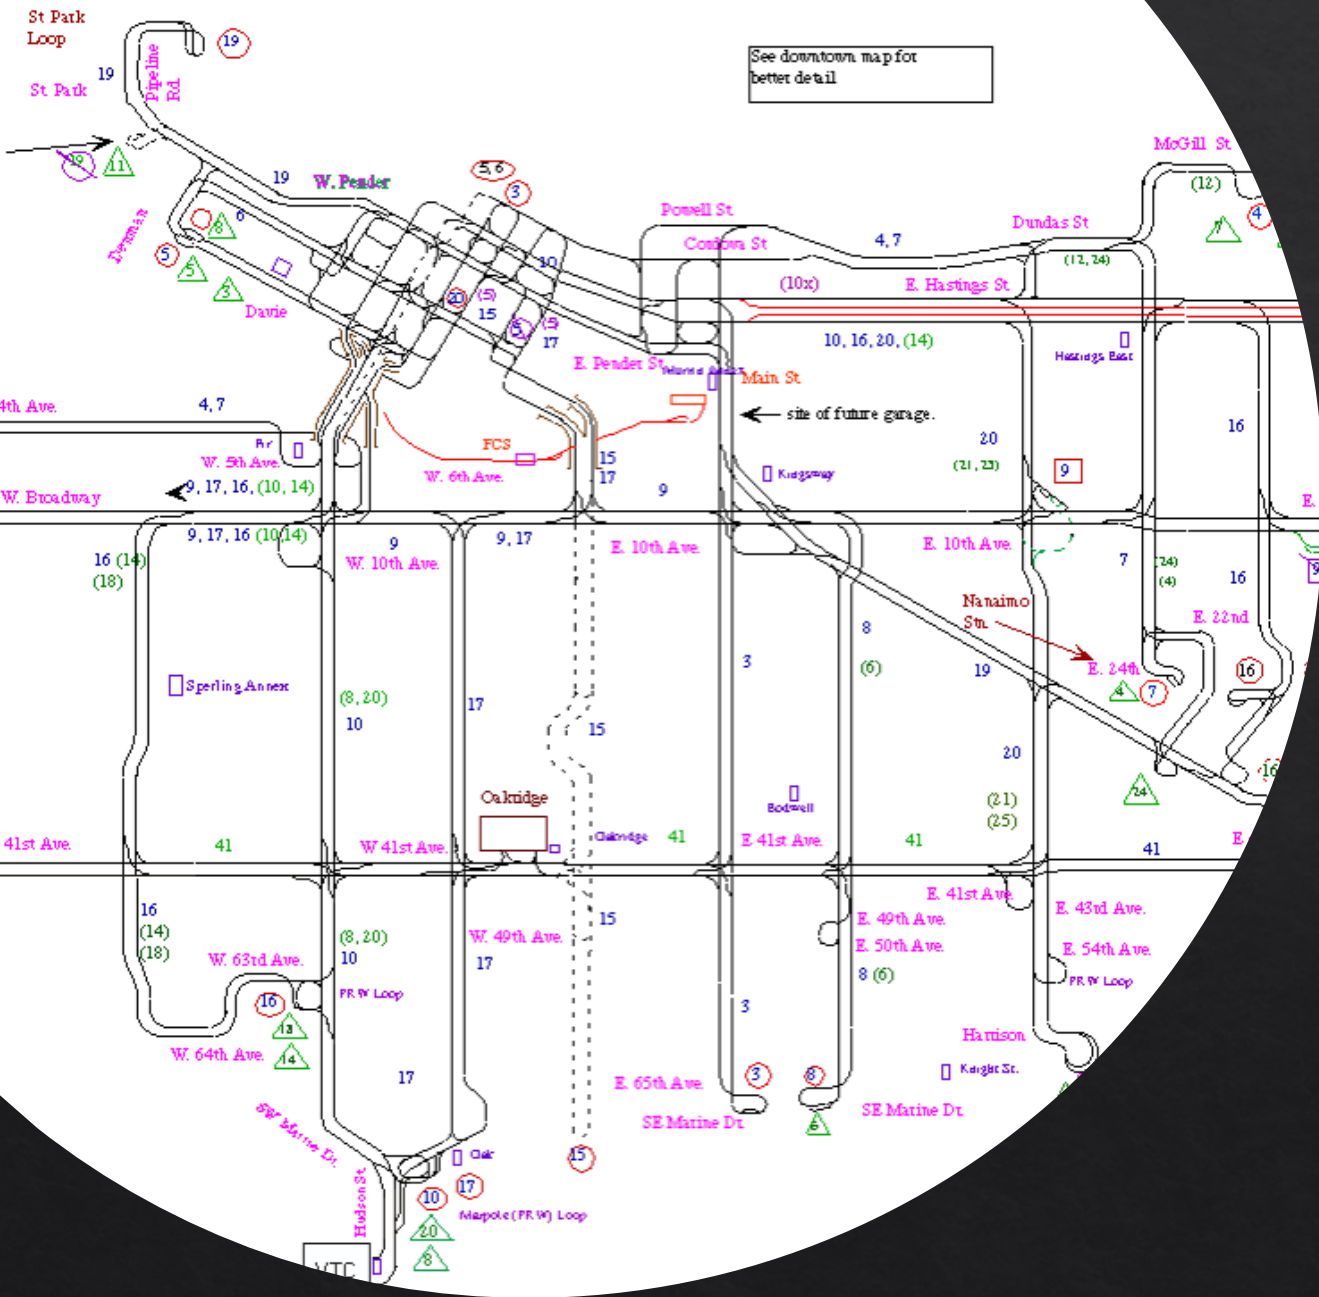

## Treatment Process

## Treatment Center

# Vancouver Trolley Buses: Eco-Friendly Transportation

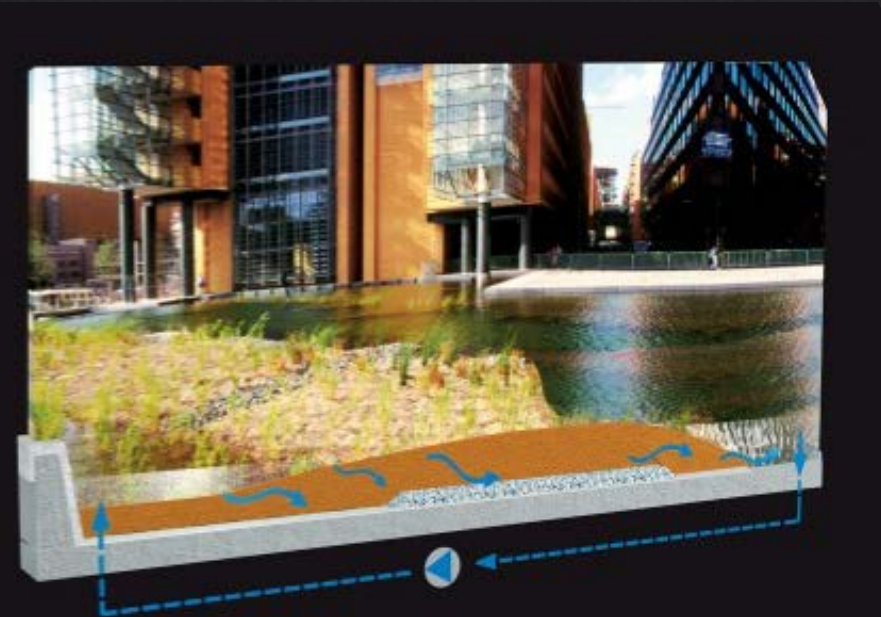

# Tanner Springs Park: Stormwater Management

# Urban Storm Water Management: Berlin

- ◇ Multiple Interconnected Pools
  - ◇ Enhance the Public Realm
    - ◇ Reduces heat in surrounding area
    - ◇ Collects & removes dust
  - ◇ Used for non-potable purposes
  - ◇ Reduce water related issues caused in heavy rainfalls
    - ◇ Relieve storm water systems

# Thank You
